

Abstract

5       The present invention provides a database and  
information system arrangement for use in designing an  
operational architecture for a warfare mission. An  
operational process section describes information related to  
operational activities of the warfare mission. A data  
section identifies input data used by the operational  
activities and output data resulting from the operational  
activities. An organizational section identifies an  
10       organizational hierarchy and assets used to carry out the  
operational activities and identifies storage locations for  
the input data and the output data.
